PROXIMITY access control - simple and secure

PROXIMITY Access control gives you control over who has access to your building.

Keys also do this - so what is the difference?

When you lose a key, you have the expense and inconvenience of replacing locks and all the other keys, or you accept that your building is no longer secure.

PROXIMITY access control systems allow you to void an individual 'key' (a card or keyfob). There is no need to replace any locks or 'keys'.

PROXIMITY is a user friendly, reliable and convenient way to unlock a door. No more searching for keys or locks getting jammed.

PROXIMITY is maintenance free.

Companies who use PROXIMITY discover that their building is secure from casual intruders.

PROXIMITY gives easy, convenient access for those who have a right to enter the building.

This booklet explains how it works.

4 Simple steps to control

- ▼ A PROXIMITY reader is installed
- ▼ A card pack is supplied to accompany the reader
- ▼ The installer presents the enrolment card to the reader
- ▼ All cards in the card pack are immediately valid for use

The Enrolment card is in the card pack.

The card pack is unique to your building and contains either ten, twenty five, fifty or one hundred user cards.

All you have to do is issue the cards

The card pack contains user cards and shadow cards.

The user cards are in pockets on the left hand side of the wallet.

The shadow cards are in pockets on the right hand side of the wallet.

Simply give a user card to your member of staff.

Record their name on the corresponding shadow card.

The shadow card pockets have a cut out window to make writing on the shadow card easy.

Gaining access

The user presents their card to the reader and the door unlocks.

Cards or keyfobs are easy to carry in a wallet or on a keyring.

Cards and keyfobs have no batteries.

Convenience and ease of access are assured.

Lost Card!

Open the card wallet and remove the shadow card with that person's name on.

Go to the reader and present the shadow card.

The lost user card is now barred.

If found, the lost user card will no longer allow access.

It is as simple as that for most system users!

Sit back - enjoy your coffee and relax in the knowledge that your building is secure.

For most situations there is nothing more to learn.

Should you wish to know about PROXIMITY's other more powerful features - read on.

Restricting access by token colour

PROXIMITY systems can be used to control access through several doors in a building. Access can be restricted to certain areas based on the colour of a user's token. A function card pack is required.

The example above shows a squash club with 4 doors controlled by PROXIMITY.

- - Green tokens are issued to club members
- - Amber tokens are issued to Administration staff
- - Red tokens are issued to Management staff

Members are permitted access only through the main entrance and into the squash courts.

Administration staff are allowed everywhere other than the Manager's office.

Management staff have unrestricted access.

The colour 'zoning' system is easy to manage and keeps people where they are meant to be!

Keypad and PROXIMITY combined

The new KP reader combines PROXIMITY technology with a keypad. This allows highly secure 'card plus PIN' access control.

A user token is presented to the KP reader in the usual way. The user must then enter their PIN before entry is allowed.

The extra security comes from requiring both possession (of a valid token) and knowledge (of the appropriate PIN).

In addition to card plus PIN, the KP reader can be configured to accept a valid code, just user tokens or any combination.

The KP reader is backlit for ease of use in low light conditions.
